I am an owner on this app that has active lotteries and active registrations.

I want to message one of my registrants to let them know I will have to cancel their registration due to fire warnings.

And I want to notify all entrants on a lottery about the fire warnings and that their registrations may be rejected.

I begin by clicking on the “View Active Reservations” button

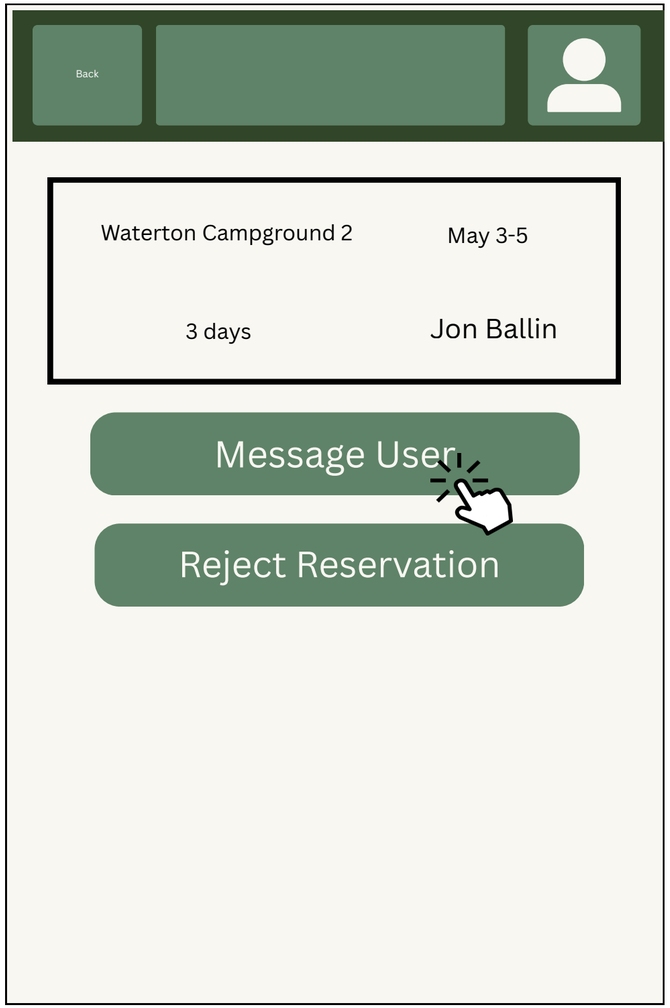

I am taken to this scrollable page that lists all of my upcoming active (not cancelled or rejected) registrations.

I find the reservation I want to message and click on it.

I am taken to a screen that shows me the same details and lets me decide to message the user or Reject their reservation

I click “Message User”

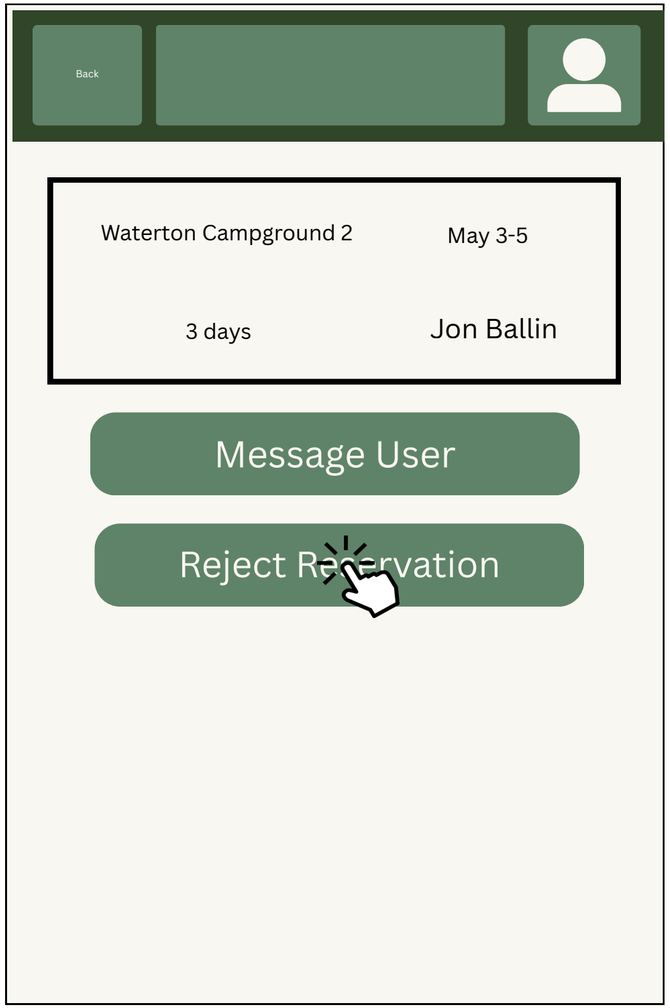

I am prompted to write the message
I enter the message explaining the situation to John

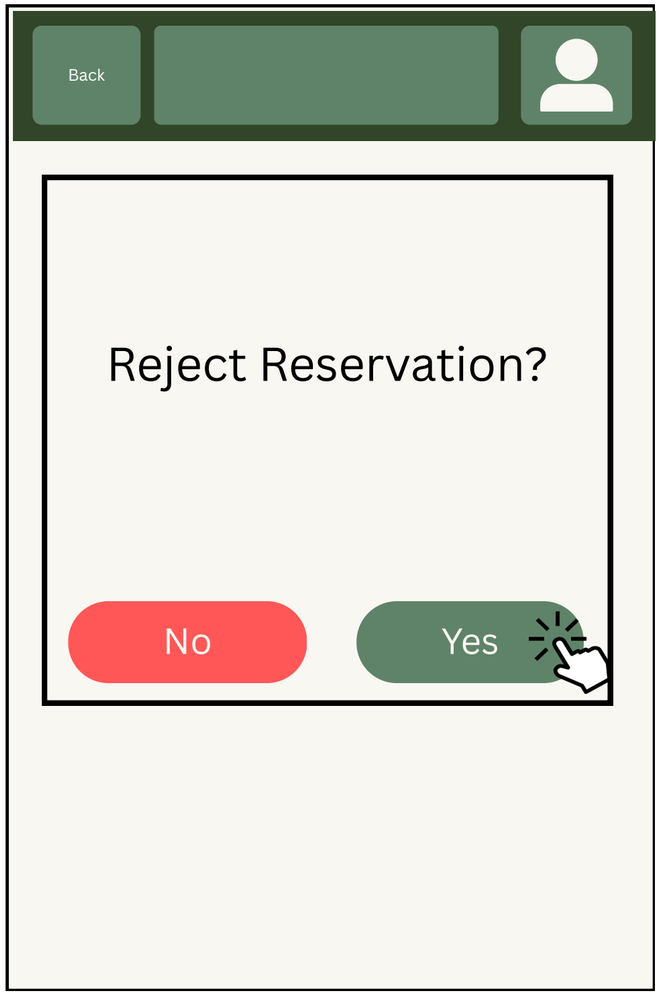

Once my message is created, I click “Send Message”

I am returned to the booking details screen. Since I have sent the message, I click “Reject Reservation” to cancel Jon’s reservation.

A confirmation screen pops up to which I say yes.

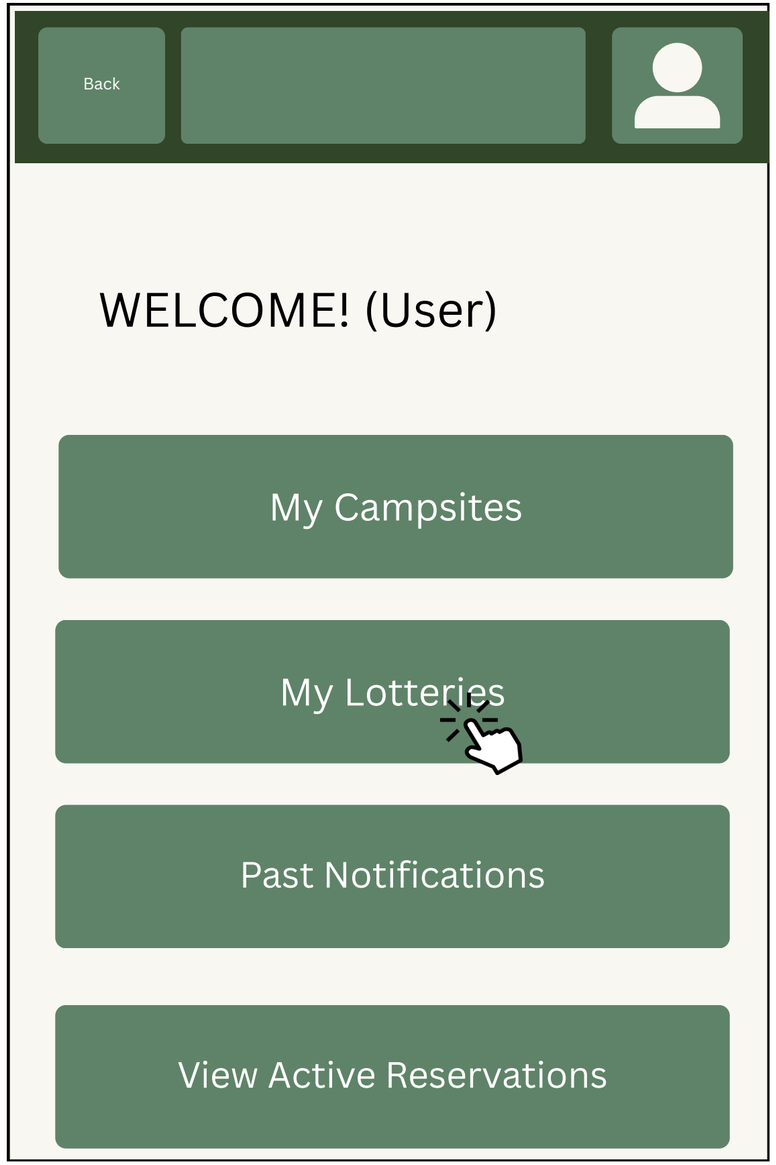

I am taken back to the reservations list and can see that the rejected reservation is no longer there.

I click Back to return to the menu

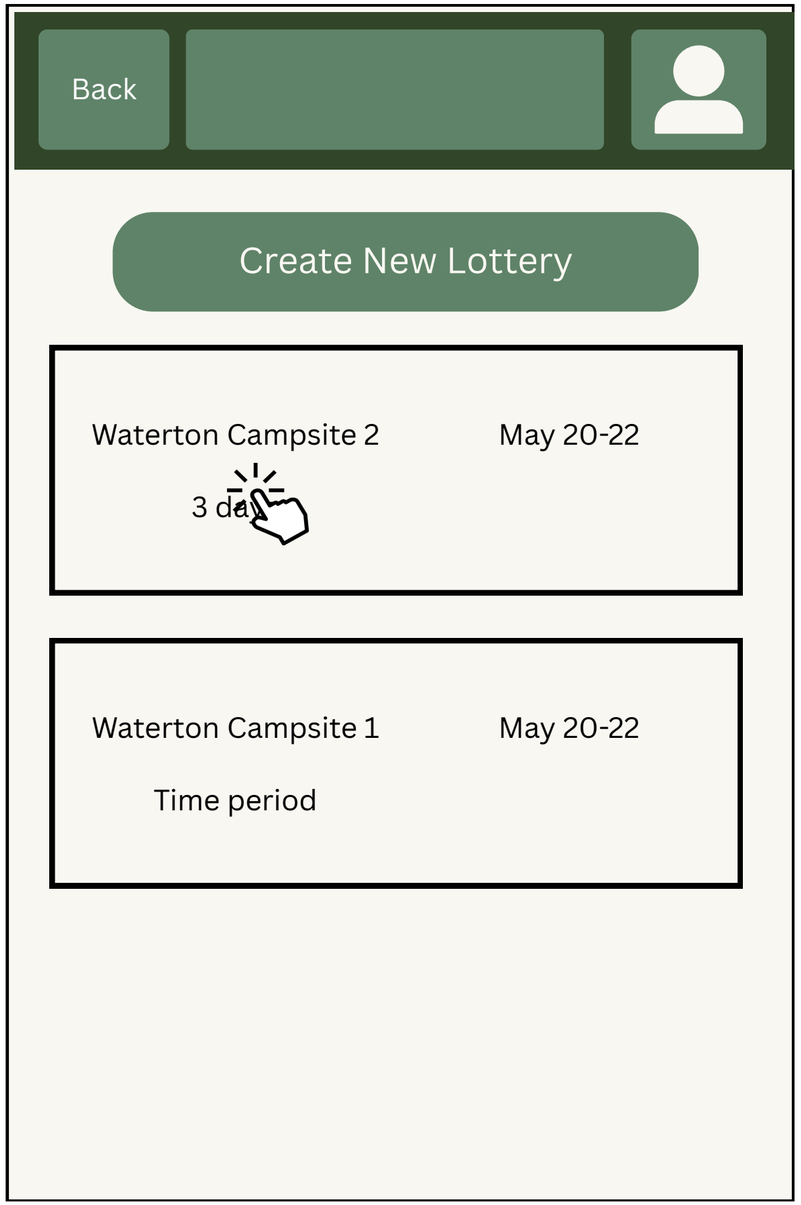

Returning to the Homepage,
I now want to send the notification
so I click on “My Lotteries”

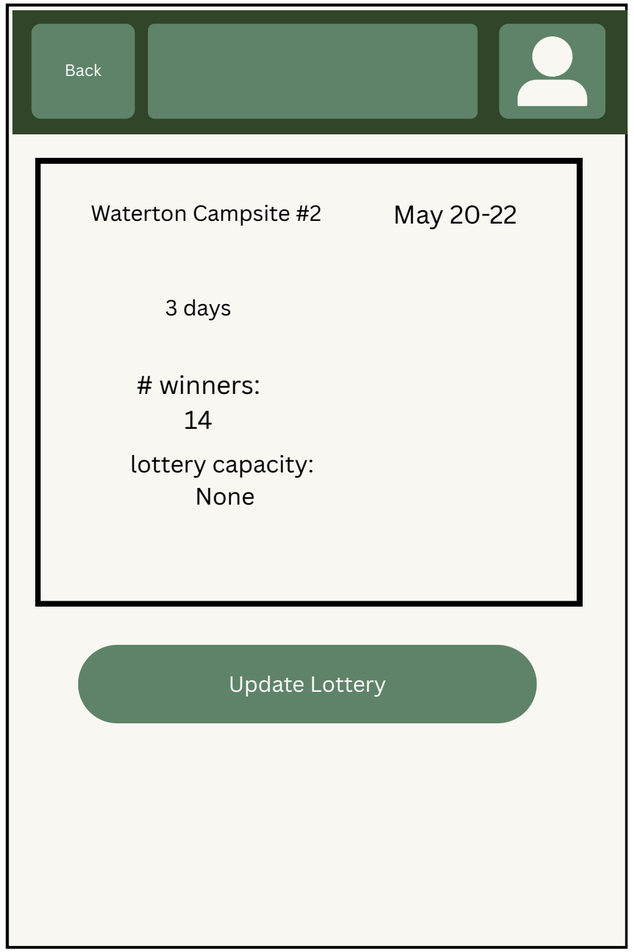

I am brought to a page with all of my active lotteries.

I click on the lottery I want to message

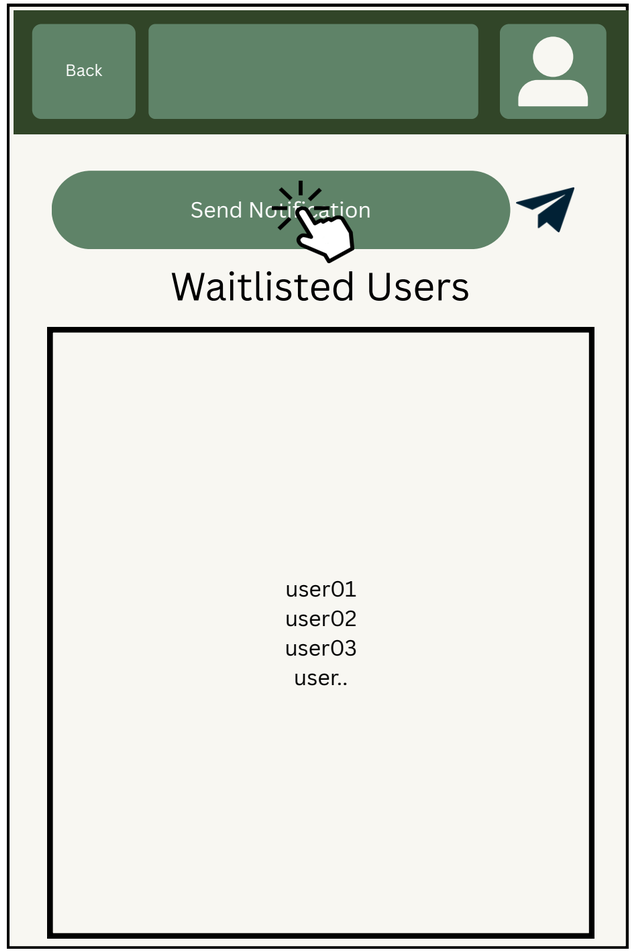

I am brought to the scrollable window where I can view all of my lottery’s details.

I click on the Send Notification Button

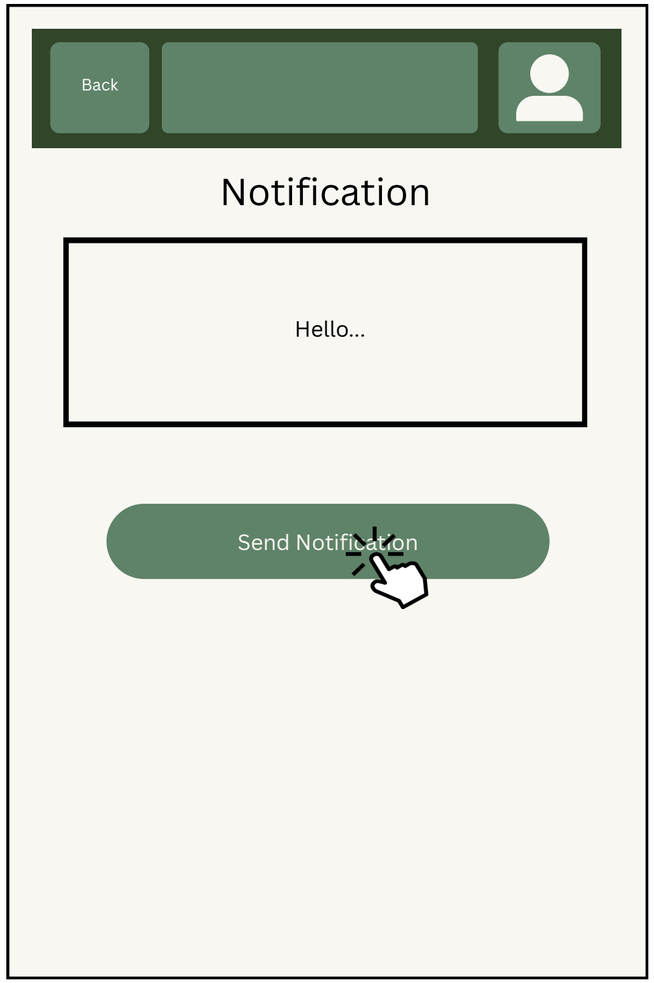

Scroll

I am brought to a screen where I can write a notification to all entrants in the lottery.

I write the message I want to send and click “Send Notification”

I am returned to the Lottery Details page. I know that my notification has been sent to all entrants in the lottery.
